

627 Series Pressure Reducing Regulators

Introduction

The 627 Series direct-operated pressure reducing regulators (Figure 1) are for low and high-pressure systems. These regulators can be used with natural gas, air, or a variety of other gases. Performance characteristics vary according to construction (see the Specifications section).

Features

- **Internal Relief Valve**—Types 627R, 627LR, and 627MR regulators have an internal relief valve, which in many cases eliminates the usual requirement for an external relief valve, thereby reducing equipment and maintenance costs. Refer to the Specifications section for performance data.
- **Types 627R, 627LR, and 627MR Travel Stop**—The internal relief valve still works if the disk or linkage fails. The pusher post (Figure 6) contacts the travel stop of the lever retainer and, as the diaphragm continues to rise, it opens the relief valve.
- **Relief Operation Indicator**—A rubber cap (Figure 7) slipped on the vent assembly pops off when the relief valve opens, indicating the relief valve has opened since the last inspection.
- **Easy to Maintain**—Trim parts can be replaced without removing the regulator body from the pipeline. A two-bolt connection between the body and diaphragm casing simplifies disassembly for maintenance.
- **Installation Adaptability**—The diaphragm case and/or regulator body can be rotated in any of four positions to allow regulator installation in locations with limited space (Figure 8). The regulator may be installed in any position without affecting operation as long as the spring case vent is protected from the elements.
- **Application Versatility**—The different 627 Series constructions can be used as farm tap regulators, regulator-relief valves, monitoring regulators, or high-pressure industrial regulators.

W4793

Figure 1. Typical 627 Direct-Operated Pressure Reducing Regulator

- **Extended Body Option**—The Type 627 Long Body is available with same face-to-face dimensions as the Type 630 with threaded NPT end connections.
- **Tamper-Resistant**—An adjusting screw locknut and protective cap (Figure 2) is standard on all 627 Series regulators to discourage tampering with the pressure setting.
- **Wide Range of Flow Capabilities**—A selection of body sizes and orifice sizes is available to satisfy various flow requirements.
- **Tight Shutoff Capability**—A flat-faced disk of Nitrile (NBR), Nylon (PA), or Fluorocarbon (FKM) provides excellent shut-off capability.

Bulletin 71.1:627

Specifications

The Specifications section gives some general specifications for the 627 Series regulators. The nameplates give detailed information for a particular regulator as it comes from the factory.

Available Constructions

- Type 627:** Direct-operated pressure reducing regulator equipped with a pitot tube for greater regulated capacities (Figure 2).
- Type 627R:** Type 627 with internal relief and open throat (Figure 3).
- Type 627LR:** Type 627R with light rate relief spring (Figure 3).
- Type 627M:** Type 627 with a stem seal between the body outlet pressure and diaphragm case. Pressure is measured under the diaphragm through the 1/4 NPT downstream control line connection (Figure 2).
- Type 627MR:** Type 627M with internal relief (Figure 4).
- Type 627H:** Type 627 with a diaphragm limiter to deliver a higher outlet pressure (Figure 5).
- Type 627HM:** Type 627H with a stem seal between the body outlet pressure and diaphragm case. Pressure is measured under the diaphragm through the 1/4 NPT downstream control line connection (Figure 5).

Body Sizes and End Connection Styles

BODY SIZE		END CONNECTION STYLE	CONSTRUCTION AVAILABLE
NPS	DN		
3/4	-----	NPT	All
1	25	NPT, CL150 RF, CL300 RF, CL600 RF, and Long Body	
2	50	NPT, CL150 RF, CL300 RF, CL600 RF, and Long Body	

Maximum Inlet Pressure⁽¹⁾ (Body Rating)

- NPT Stainless Steel:** 2000 psig / 138 bar
- Flanged Stainless Steel:** 1440 psig / 99.3 bar
- NPT Steel:** 2000 psig / 138 bar
- Flanged Steel:** 1500 psig / 103 bar
- Ductile Iron:** 1000 psig / 69.0 bar

Maximum Valve Disk Inlet Pressure Rating⁽¹⁾

- Nylon (PA) Disk:** 2000 psig / 138 bar
- Nitrile (NBR) Disk:** 1000 psig / 69.0 bar
- Fluorocarbon (FKM) Disk:** 300 psig / 20.7 bar

Internal Relief Performance

Type 627R: See Table 4 and Figure 9

Type 627LR: See Table 5

Type 627MR: Limited by field-installed control line piping

Regulator Capacities

Type 627, 627M, or 627MR: See Tables 6 to 9

Type 627H or 627HM: See Tables 10 to 12

Type 627R: See Tables 13 to 14

Flow Coefficients

See Table 15

IEC Sizing Coefficients

See Table 16

Construction Materials

Body: Ductile iron, WCC steel, stainless steel

Spring Case and Diaphragm Case: WCC steel, stainless steel, ductile iron, or die cast aluminum

Orifice: Aluminum (**standard**) or stainless steel

Disk Holder with Valve Disk:

*2000 psig / 138 bar Maximum Pressure:
Aluminum or stainless steel with Nylon (PA)*

*1000 psig / 69.0 bar Maximum Pressure:
Aluminum (**standard**) or stainless steel
with Nitrile (NBR)*

*300 psig / 20.7 bar Maximum Pressure:
Stainless steel or aluminum with
Fluorocarbon (FKM) disk*

O-Rings:

Nitrile (NBR) or Fluorocarbon (FKM)

Diaphragm:

Types 627H and 627HM: Neoprene(CR)

All Others: Nitrile (NBR) or Fluorocarbon (FKM)

1. The pressure/temperature limits in this Bulletin or any applicable standard limitation should not be exceeded.

2. Types 627, 627H, 627R, and 627LR are limited by maximum diaphragm casing pressure.

Approximate Weight

Ductile Iron, Steel, or Stainless Steel Casings:

10 pounds / 5 kg

Aluminum Casing: 6.3 pounds / 3 kg

1. The pressure/temperature limits in this Bulletin or any applicable standard limitation should not be exceeded.
3. Stainless steel body is rated to -40°F / -40°C. Steel and Ductile Iron bodies are rated to -20°F / -29°C.

Principle of Operation

Refer to Figures 2 through 5. When downstream demand decreases, the pressure under the diaphragm increases. This pressure overcomes the regulator setting (which is set by a spring). Through the action of the pusher post assembly, lever, and valve stem the valve disk moves closer to the orifice and reduces gas flow. If demand downstream increases, pressure under the diaphragm decreases. Spring force pushes the pusher post assembly downward and the valve disk moves away from the orifice allowing more flow through the body to the downstream system.

Product Description

Types 627 and 627H Direct-Operated Pressure Reducing Regulators

The Types 627 and 627H regulators provide economical pressure reducing control for a variety of residential, commercial, and industrial applications. The regulator pitot tube located in a high velocity stream provides dynamic boost that compensates for outlet pressure drop (see Tables 6 through 12).

Type 627 Long Body

The Type 627 Long Body regulator can be used as a drop-in replacement for existing Type 630 installations without the need to modify piping.

Internal Relief for Type 627R, 627LR, or 627MR Regulator

The Types 627R and 627LR internal relief performance values (Tables 4 and 5) were obtained **by removing the disk assembly** from the regulator, see Figure 9. For

the Type 627R, 627LR, or 627MR regulator, the internal relief across the diaphragm (Figure 3 or 4) provides overpressure protection in many applications. As outlet pressures build-up above the start-to-discharge point, the diaphragm moves off the relief valve seat allowing the excess pressure to bleed out through the screened vent.

For extra protection, should failure conditions exist which would prevent normal operation of the regulator (for example, disk broken off, or disk erosion), the pusher post contacts the lever retainer (Figure 6) causing the relief valve assembly to open. Since the diaphragm continues to rise as downstream pressure builds, it opens the relief valve, thereby opening the valve. This internal relief may be adequate for the application.

Downstream Control Line for Type 627M, 627HM, or 627MR Regulator

A Type 627M, 627HM, or 627MR regulator has a blocking throat stem seal with O-rings and a 1/4 NPT control line connection in the diaphragm case (Figure 4). A regulator with a downstream control line is used for monitoring applications or other applications where other equipment is installed between the regulator and the pressure control point. The stem seal separates the body outlet pressure from the diaphragm case.

Installation

Regulator operation within ratings does not preclude the possibility of damage from debris in the lines or from external sources. A regulator should be inspected for damage periodically and after any overpressure condition. Ensure that the operating temperature capabilities listed in Specifications section are not exceeded.

1. The pressure/temperature limits in this Bulletin, and any applicable standard or code should not be exceeded.

2. Temperature may decrease these maximum pressures.

Note

If the regulator is shipped mounted on another unit, install that unit according to the appropriate Instruction manual.

Overpressure Protection

627 Series regulators have outlet pressure ratings that are lower than their inlet pressure ratings. A pressure-relieving or pressure-limiting device must be provided by the user for the Types 627, 627H, 627M, and 627HM regulators if the inlet pressure can exceed the outlet pressure rating, since these regulators do not have internal relief.

Types 627R and 627LR regulators provide internal relief which limits the total outlet pressure build-up over setpoint. Use Table 4 or 5 and the following example to determine the maximum inlet pressure allowed to keep the maximum allowable downstream pressure from being exceeded.

Given:

- Desired outlet pressure setting : 40 psig / 2.8 bar
- Maximum allowable downstream pressure : 125 psig / 8.6 bar
- Orifice size : 1/4 inch / 6.35 mm

What is the maximum inlet pressure?

- Control spring range (first column) : 35 to 80 psig / 2.4 to 5.5 bar
- Outlet pressure setting (second column) : 40 psig / 2.8 bar
- Maximum allowable downstream pressure (third column) : 125 psig / 8.6 bar
- Orifice size column across from the 125 psig / 8.6 bar maximum allowable pressure and the column under 1/4-inch / 6.35 mm orifice size : 1/4 inch / 6.4 mm

From Table 4, the maximum inlet pressure for this example is 300 psig / 20.7 bar.

In many cases the internal relief of Types 627R and 627LR offers full capacity overpressure protection. No additional relief capacity is needed if the actual inlet pressure is equal to or less than the inlet pressure shown under the Maximum Inlet Pressure column heading in Tables 4 and 5.

If the maximum allowable downstream system pressure is less than any of the pressures shown in the third column

Table 2. Maximum Inlet Pressures and Outlet Pressure Ranges

		1/2	13	750	51.7	750	51.7	300	20.7

1. For inlet pressure in excess of 1000 psig / 69.0 bar, refer to the maximum body and disk pressure ratings in the Specifications section.

2. For pressure settings under 10 psig / 0.69 bar, inlet pressure should be limited to approximately 100 psig / 6.9 bar so the setpoint adjustment can be obtained.

3. The unbalance forces change from the wide-open monitor mode to an active regulator mode such that the Type 627M or 627HM should have a 3/8 inch / 9.5 mm or larger orifice.

■ - Shaded areas indicate that Fluorocarbon (FKM) and Nylon (PA) disk material are not available.

Bulletin 71.1:627

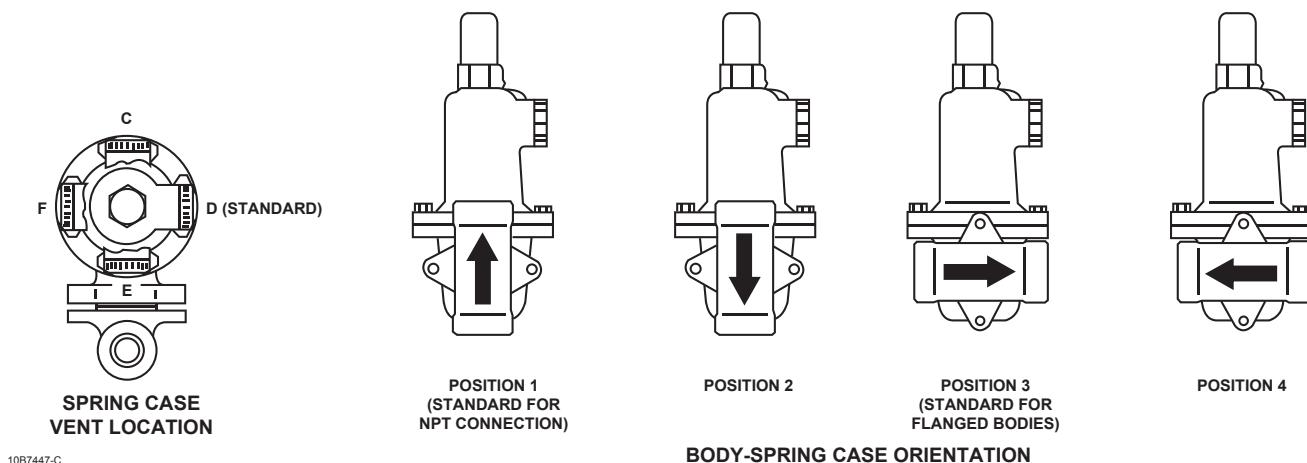

Figure 8. 627 Series Spring Case and Vent Location

of Tables 4 and 5, use a separate relief valve or a monitor regulator since the internal relief will not open at pressures lower than shown in the table.

If the actual inlet pressure is higher than the pressure shown, in the Maximum Inlet Pressure column, to protect to the level shown, an additional relief valve is needed to supplement the relief capacity of the Type 627R or 627LR internal relief or a full capacity separate relief valve or monitor regulator may be used.

To size a supplemental relief valve to use with the Type 627R or 627LR:

1. Use the universal sizing equation to calculate the wide-open capacity of the regulator port (Q_1) using:
 - a. Actual inlet pressure (P_1), psia
 - b. Maximum allowable downstream system pressure (P_2) from Table 4 or 5, column 3
 - c. C_g from Table 15
2. Use the universal sizing equation to calculate the internal relief flow (Q_2) using:
 - a. Maximum inlet pressure (P_1) from Table 4 columns 4 through 9 for Type 627R or Table 5 columns 4 through 7 for Type 627LR (use the pressure from the table even though the actual pressure will be higher). Remember the equation requires pressures to be converted to psia.
 - b. Maximum allowable downstream system pressure (P_2) from Table 4 or 5
 - c. C_g from Table 15
3. Calculate supplemental relief capacity:
 - a. $Q_{\text{supplemental relief}} = Q_1 - Q_2$

Example:

Outlet pressure setting : 10 psig / 0.69 bar

Maximum allowable downstream system pressure : 60 psig / 4.1 bar

Inlet pressure : 300 psig / 20.7 bar

Orifice size : 1/4 inch / 6.4 mm

Step 1.

$$P_1 = 300 \text{ psig} / 20.7 \text{ bar}$$

$$P_2 = 60 \text{ psig} / 4.1 \text{ bar}$$

$$C_g, 1/4\text{-inch} / 6.4 \text{ mm orifice} = 50$$

$$Q_1 = 20,300 \text{ SCFH} / 544 \text{ Nm}^3/\text{h}$$

Step 2.

$$P_1 = 190 \text{ psig} / 13.1 \text{ bar}$$

$$P_2 = 60 \text{ psig} / 4.1 \text{ bar}$$

$$C_g, 1/4\text{-inch} / 6.4 \text{ mm orifice} = 50$$

$$Q_2 = 13,200 \text{ SCFH} / 354 \text{ Nm}^3/\text{h}$$

Step 3.

$$Q_{\text{supplemental relief}} = Q_1 - Q_2$$

$$Q_{\text{supplemental relief}} = 20,300 - 13,200 = 7100 \text{ SCFH} / 544 - 354 = 190 \text{ Nm}^3/\text{h}$$

Overpressurizing any portion of a regulator or associated equipment may cause personal injury, leakage, or property damage due to bursting of pressure-containing parts or explosion of accumulated gas.

If needed, provide appropriate pressure-relieving or pressure-limiting devices to ensure that none of the specifications are exceeded. Regulator operation within ratings does not prevent the possibility of damage from external sources such as debris in the pipeline.

Refer to the relief sizing coefficients in Table 15 and the Capacity Information section to determine the required external relief valve capacity.

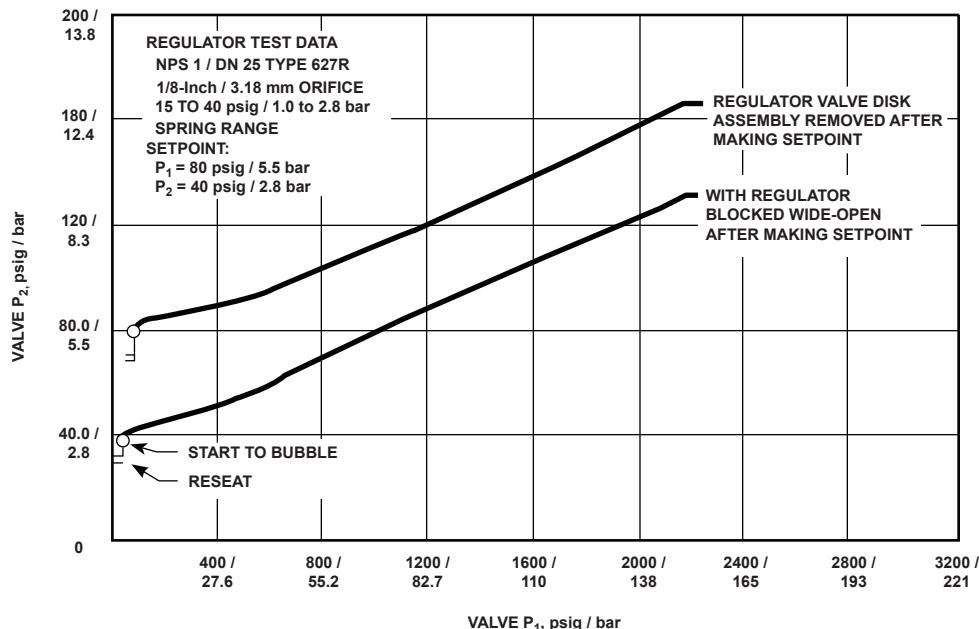

Figure 9. Relief Testing Methods, Outlet vs. Inlet Pressures

Capacity Information

Natural gas regulating capacities at selected inlet pressures and outlet pressure settings are given in Tables 6 to 9 for the Type 627 or 627M, in Tables 10 to 12 for the Type 627H, and in Tables 13 to 14 for the Type 627R regulators. Flows are in SCFH (60°F and 14.7 psia) and Nm³/h (0°C and 1.01325 bar) of 0.6 specific gravity natural gas.

To determine the equivalent capacities for other gases, multiply the table capacity by the following appropriate conversion factor: 0.775 for air, 0.789 for nitrogen, 0.628 for propane, or 0.548 for butane. For gases of other specific gravities, multiply the given capacity by 0.775, and divide by the square root of the appropriate specific gravity.

Then, if capacity is desired in Nm³/h at 0°C and 1.01325 bar, multiply the values in SCFH by 0.0268.

To determine wide-open flow capacities for relief sizing use the following formula:

$$Q = \sqrt{\frac{520}{GT}} C_g P_1 \sin\left(\frac{3417}{C_1} \sqrt{\frac{\Delta P}{P_1}}\right) \text{ DEG}$$

where,

Q = gas flow rate, SCFH

G = specific gravity of the gas

T = absolute temperature of gas at inlet, °Rankine

C_g = gas sizing coefficient

P_1 = absolute inlet pressure, psia

C_1 = flow coefficient ($C_g \div C_v$)

ΔP = pressure drop across the regulator, psi

To obtain the published capacities, the inlet and outlet piping should be the same as the regulator size.

	40 / 2.8	2000 / 138	14,000 / 375						
<p>1. Capacity is based on 20% droop unless otherwise noted below. 2. For pressure settings under 10 psig / 0.69 bar, inlet pressure should be limited to approximately 100 psig / 6.9 bar so the setpoint adjustment can be obtained. 3. For 5 psig / 0.34 bar pressure setpoint the droop is 2 psig / 0.14 bar.</p> <p>■ - Blank areas indicate where maximum operating inlet pressure for a given orifice is exceeded. ■ - Shaded areas indicate where a Type 627MR regulator should not be used because unbalanced forces can cause the internal relief valve to start-to-discharge during normal operation. Refer to Table 4.</p>

1. Capacity is based on 20% droop unless otherwise noted below.

 - Blank areas indicate where maximum operating inlet pressure for a given orifice is exceeded. - Shaded areas indicate where a Type 627MR regulator should not be used because unbalanced forces can cause the internal relief valve to start-to-discharge during normal operation. Refer to Table 4.

		2000 / 138	17,000 / 456					

1. Capacity is based on 20% droop unless otherwise noted below.

2. For pressure settings under 10 psig / 0.69 bar, inlet pressure should be limited to approximately 100 psig / 6.9 bar so the setpoint adjustment can be obtained.

3. For 5 psig / 0.34 bar pressure setpoint the droop is 2 psig / 0.14 bar.

- Blank areas indicate where maximum operating inlet pressure for a given orifice is exceeded.

- Shaded areas indicate where a Type 627MR regulator should not be used because unbalanced forces can cause the internal relief valve to start-to-discharge during normal operation. Refer to Table 4.

- continued -

- Capacity is based on 20% droop unless otherwise noted below.
 - For pressure settings under 10 psig / 0.69 bar, inlet pressure should be limited to approximately 100 psig / 6.9 bar so the setpoint adjustment can be obtained.
 - For 5 psig / 0.34 bar pressure setpoint the droop is 2 psig / 0.14 bar.
- - Blank areas indicate where maximum operating inlet pressure for a given orifice is exceeded.

- Capacity is based on 20% droop unless otherwise noted below.
- For pressure settings under 10 psig / 0.69 bar, inlet pressure should be limited to approximately 100 psig / 6.9 bar so the setpoint adjustment can be obtained.
- For 5 psig / 0.34 bar pressure setpoint the droop is 2 psig / 0.14 bar.
- Blank areas indicate where maximum operating inlet pressure for a given orifice is exceeded.
- Shaded areas indicate where a Type 627MR regulator should not be used because unbalanced forces can cause the internal relief valve to start-to-discharge during normal operation. Refer to Table 4.

	500 / 34.5	750 / 51.7	6600 / 177	12,000 / 322	27,200 / 729	49,000 / 1313	91,000 / 2439	
		1000 / 69.0	8700 / 233	16,000 / 429	36,100 / 967	65,000 / 1742		
		1250 / 86.2	11,000 / 295	19,000 / 509	45,000 / 1206	81,000 / 2171		
		1500 / 103	13,000 / 348	22,000 / 590	54,000 / 1447			
		1750 / 121	15,000 / 402	25,000 / 670	63,000 / 1688			
		2000 / 138	17,000 / 456	28,000 / 750	71,000 / 1903			

1. Capacity is based on 20% droop unless otherwise noted below.
 2. Small orifices and low pressure drops may cause the setpoint to shift ±15 psig / 1.0 bar.
 ■ - Blank areas indicate where maximum operating inlet pressure for a given orifice is exceeded.

1. Capacity is based on 20% droop unless otherwise noted below.

2. For pressure setting under 10 psig / 0.69 bar, inlet pressure should be limited to approximately 100 psig / 6.9 bar so that setpoint adjustment can be obtained.

■ - Blank areas indicate where maximum operating inlet pressure for a given orifice is exceeded.

Type 627M or 627HM De-Icer System Application

A 627 Series regulator can be used in a de-icer application as shown in Figure 10. As the orifice in the working regulator begins to freeze, ice formation decreases the orifice size so that the working regulator is unable to supply enough flow to satisfy the downstream demand. When downstream pressure falls below the outlet pressure setting of the Type 627M regulator, the disk of the Type 627M regulator moves off its orifice and lets alcohol flow into the main gas line. The alcohol

carried to the working regulator by the flow stream helps prevent additional ice formation on the orifice. Normal flow then resumes, and as pressure in the downstream system is restored, the Type 627M regulator shuts off. This is an economy feature which conserves both the alcohol and the number of man hours required to maintain the alcohol supply. The alcohol is supplied to the working regulator only when icing conditions exist.
